

Final Project Assignment (MERN Stack)

Objective

Build and present a complete MERN Stack application demonstrating the concepts covered during the course.

Project Selection

- Select any one project from the project ideas shared by the instructor.

Repository: <https://github.com/pantherdox/MERN-Project-Ideas>

OR

- You may build your own original project. If you choose this option, you must first submit a Software Requirements Specification (SRS) document for approval before starting development.

You may use AI tools (such as Claude) to help prepare the SRS document, but you must understand and be able to explain every section during evaluation.

Submission Requirements

- Complete source code (Frontend + Backend).
- Well-structured GitHub repository.
- Working deployed application.
- Presentation (Maximum 6 slides).
- Live project demonstration during evaluation.

Presentation Guidelines (Maximum 6 Slides)

- Slide 1: Project Title, Student Name, Brief Introduction
- Slide 2: Why you selected this project/topic
- Slide 3: Technology Stack Used (MongoDB, Express.js, React.js, Node.js and any additional libraries/APIs)
- Slide 4: Problems faced during development and how each problem was solved
- Slide 5: Deployment platform(s) used (e.g. Vercel, Render, Railway, Netlify, AWS, etc.) with application architecture or screenshots
- Slide 6: Project Demo, Key Learnings and Future Improvements

Presentation

Each student/team will deliver a live presentation of their project. You should be able to explain your project architecture, demonstrate the application, answer technical questions, and justify your implementation decisions.

Evaluation Criteria

- Project functionality
- Code quality and folder structure
- Use of MERN concepts
- Problem-solving approach
- Deployment and working demo
- Presentation clarity and ability to answer questions
